

Air circulation fans

Air circulation fans can be installed for more than one purpose, it can be either to create a more average temperature, a more average humidity or they can help for cooling purposes.

In most situations where air circulation fans are used they are 230 volt.

On this page some examples of air circulation fans used often in the greenhouse industry.

The fans standard are available in models from +/- 4000 m³/hour to 6000 m³/hour

Both models of fans you can mount with chain or with special mounting brackets, if mounting brackets are used it is important to have information on the truss to mount them on.
